

## Join the 2026 Wheat Rust Early Warning Campaign!

The RustWatch network and the Horizon Europe project IPMorama are coordinating a European wide wheat rust monitoring campaign from March to the end of June 2026 using the Wheat Rust Survey crowdsource App.

### What to do

- Report observations of **yellow rust, leaf rust, stem rust, or “no disease”** using the Wheat Rust Survey crowdsourcing app: <https://arcg.is/nn5r40>
- Provide: location name, cultivar name, growth stage, field type, disease score, and a photo using the App.

### Where

- The campaign covers fields and trials across Europe in collaboration with IPMorama partners in: Denmark, Switzerland, Italy, Spain, France, Ireland, UK, Germany, and Slovenia.

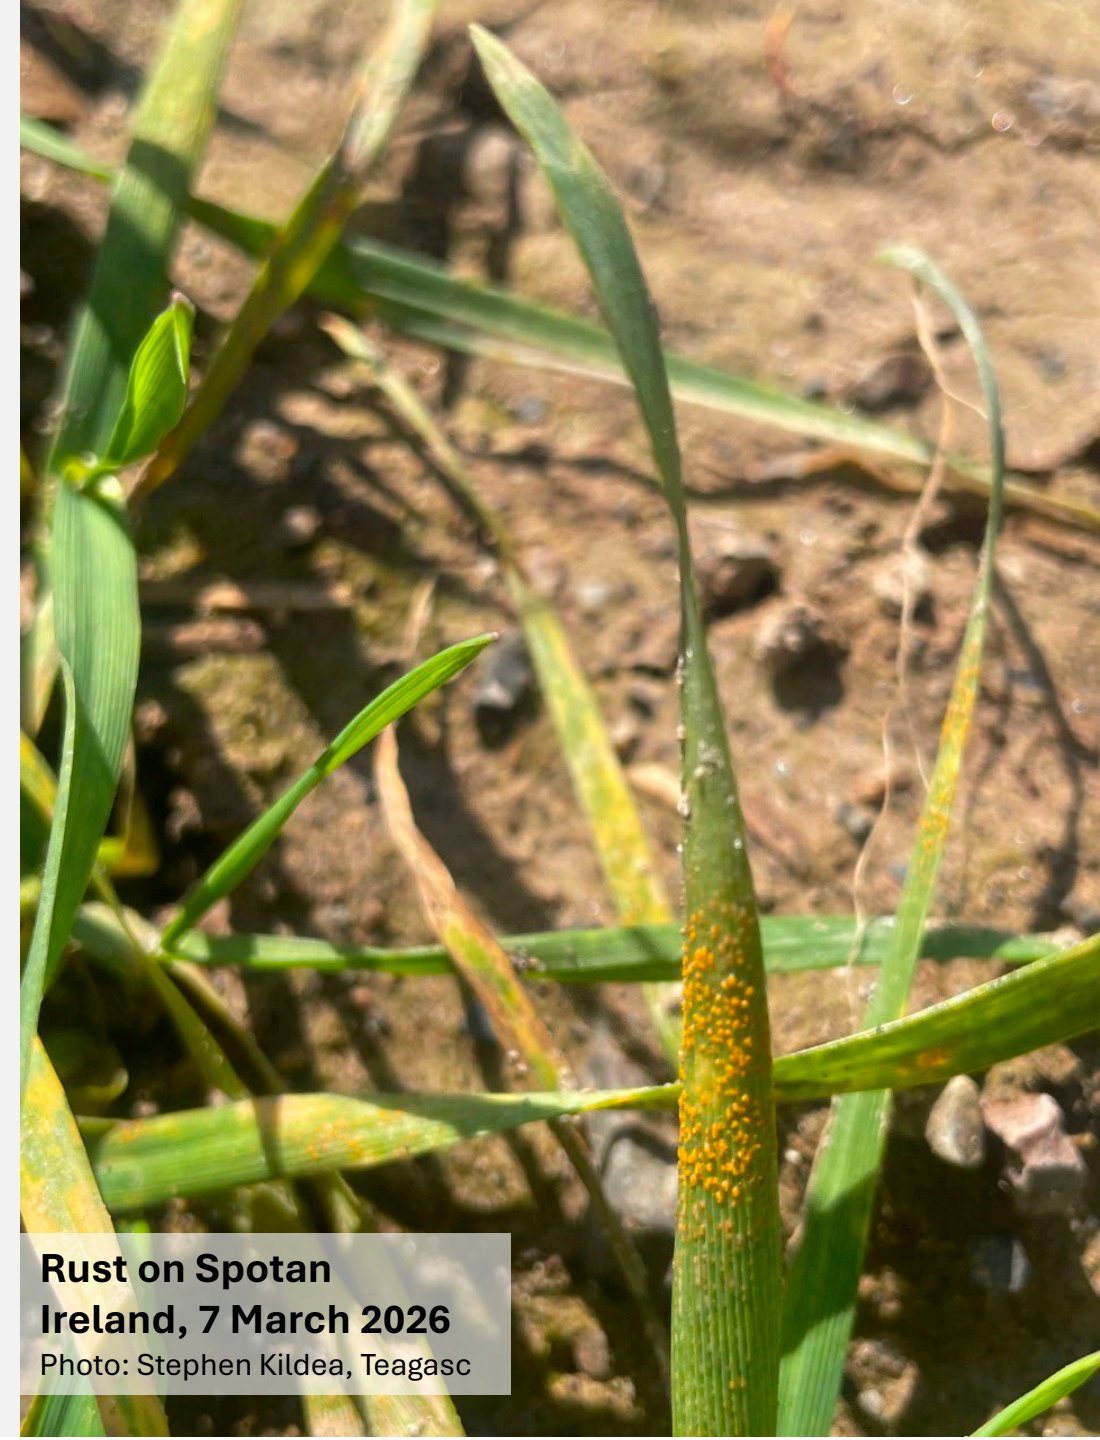

### Why

- Track whether cultivars are affected by rust disease or remain healthy.
- In case you detect yellow rust on a Yr15-variety this may indicate a medium to high risk situation.

### Results

- View uploaded observations from the App on the Wheat Rust Dashboard: <https://arcg.is/14yKb01>
- Incoming samples from the VSCU network will be tested and reported without delay.
- Alerts will be published on GRRRC, IPMorama, and regional agricultural knowledge websites.

***Help protect Europe’s wheat – your observations matter!***
